---

IDA Pro 7.2 Build 2133 (2016 Jan 18) supports Windows XP and Windows Vista, and was successfully tested working on Windows 7, Windows 8, Windows 8.1, Windows 10, Windows Server 2003, Windows Server 2008, Windows Server 2008 R2, Windows Server 2012, Windows Server 2012 R2, Windows Server 2016 and Windows Server 2019. Microsoft security researcher Mark Karguia warns that the newest version of the exploit known as the Evil Overlord of the Web could crash Windows XP and Windows Vista systems. Users running old Windows versions are advised to not upgrade to version 2.0.4.1 of IDA Pro 7.2 Build 2133 (2016 Jan 18). The paper describes observations of the 'temperature' dependent acidity of the upper atmosphere, carried out with the help of a spectrophotometer, as well as photochemical modeling of the effect of photochemical reactions on the upper-atmospheric acidity in the presence of solar radiation and low temperature. It is concluded that the primary cause of high upper-atmospheric acidity in the lower part of the atmosphere (around 10 km altitude) is the radiation-induced photochemical reactions, with minor contribution of photochemistry at higher altitudes. The rate of the processes responsible for the formation of HNO<sub>3</sub> molecules increases with altitude, which explains the strong tendency of the HNO<sub>3</sub> concentration to increase with height. 82157476af
